FIG 58

Method of entry	How to program?	How to enter?	Entry mode
Breakpoint hits	Debug TAP or software (CP14)	Program breakpoint register and/or context-ID register and comparisons succeed with Instruction Address and/or CP15 Context ID ([2]).	Halt/monitor ([1])
Software breakpoint instruction	Put a BKPT instruction into scan chain 4 (Instruction Transfer Register) through Debug TAP or Use BKPT instruction directly in the code.	BKPT instruction must reach execution stage.	Halt/monitor
Vector trap breakpoint	Debug TAP	Program vector trap register and address matches.	Halt/monitor
Watchpoint hits	Debug TAP or software (CP14)	Program watchpoint register and/or context-ID register and comparisons succeed with Instruction Address and/or CP15 Context ID ([2]).	Halt/monitor ([1])
Internal debug request	Debug TAP	Halt instruction has been scanned in.	Halt
External debug request	Not applicable	EDBGRQ input pin is asserted.	Halt

([1]): In monitor mode, breakpoints and watchpoints cannot be data-dependent.

([2]): The cores have support for thread-aware breakpoints and watchpoints, in order to enable secure debug on some particular threads.

Figure 60

Name	Meaning	Reset value	Access	Inserted in scan chain for test
Monitor mode enable bit	0: halt mode 1: monitor mode	1	R/W by programming the ICE by the JTAG (scan1) ▪ R/W by using MRC/MCR instruction (CP14)	yes
Secure debug enable bit	0: debug in non-secure world only. 1: debug in secure world and non-secure world	0	In functional mode or debug monitor mode: R/W by using MRC/MCR instruction (CP14) (only in secure supervisor mode) In Debug halt mode: No access – MCR/MRC instructions have any effect. (R/W by programming the ICE by the JTAG (scan1) if JSDAEN=1	no
Secure trace enable bit	0: ETM is enabled in non-secure world only. 1: ETM is enabled in secure world and non-secure world	0	In functional mode or debug monitor mode: R/W by using MRC/MCR instruction (CP14) (only in secure supervisor mode) In Debug halt mode: No access – MCR/MRC instructions have any effect. (R/W by programming the ICE by the JTAG (scan1) if JSDAEN=1	no
Secure user-mode enable bit	0: debug is not possible in secure user mode 1: debug is possible in secure user mode	1	In functional mode or debug monitor mode: R/W by using MRC/MCR instruction (CP14) (only in secure supervisor mode) In Debug halt mode: No access – MCR/MRC instructions have any effect. (R/W by programming the ICE by the JTAG (scan1) if JSDAEN=1	no
Secure thread-aware enable bit	0: debug is not possible for a particular thread 1: debug is possible for a particular thread	0	In functional mode or debug monitor mode: R/W by using MRC/MCR instruction (CP14) (only in secure supervisor mode) In Debug halt mode: No access – MCR/MRC instructions have any effect. (R/W by programming the ICE by the JTAG (scan1) if JSDAEN=1	no

Figure 67

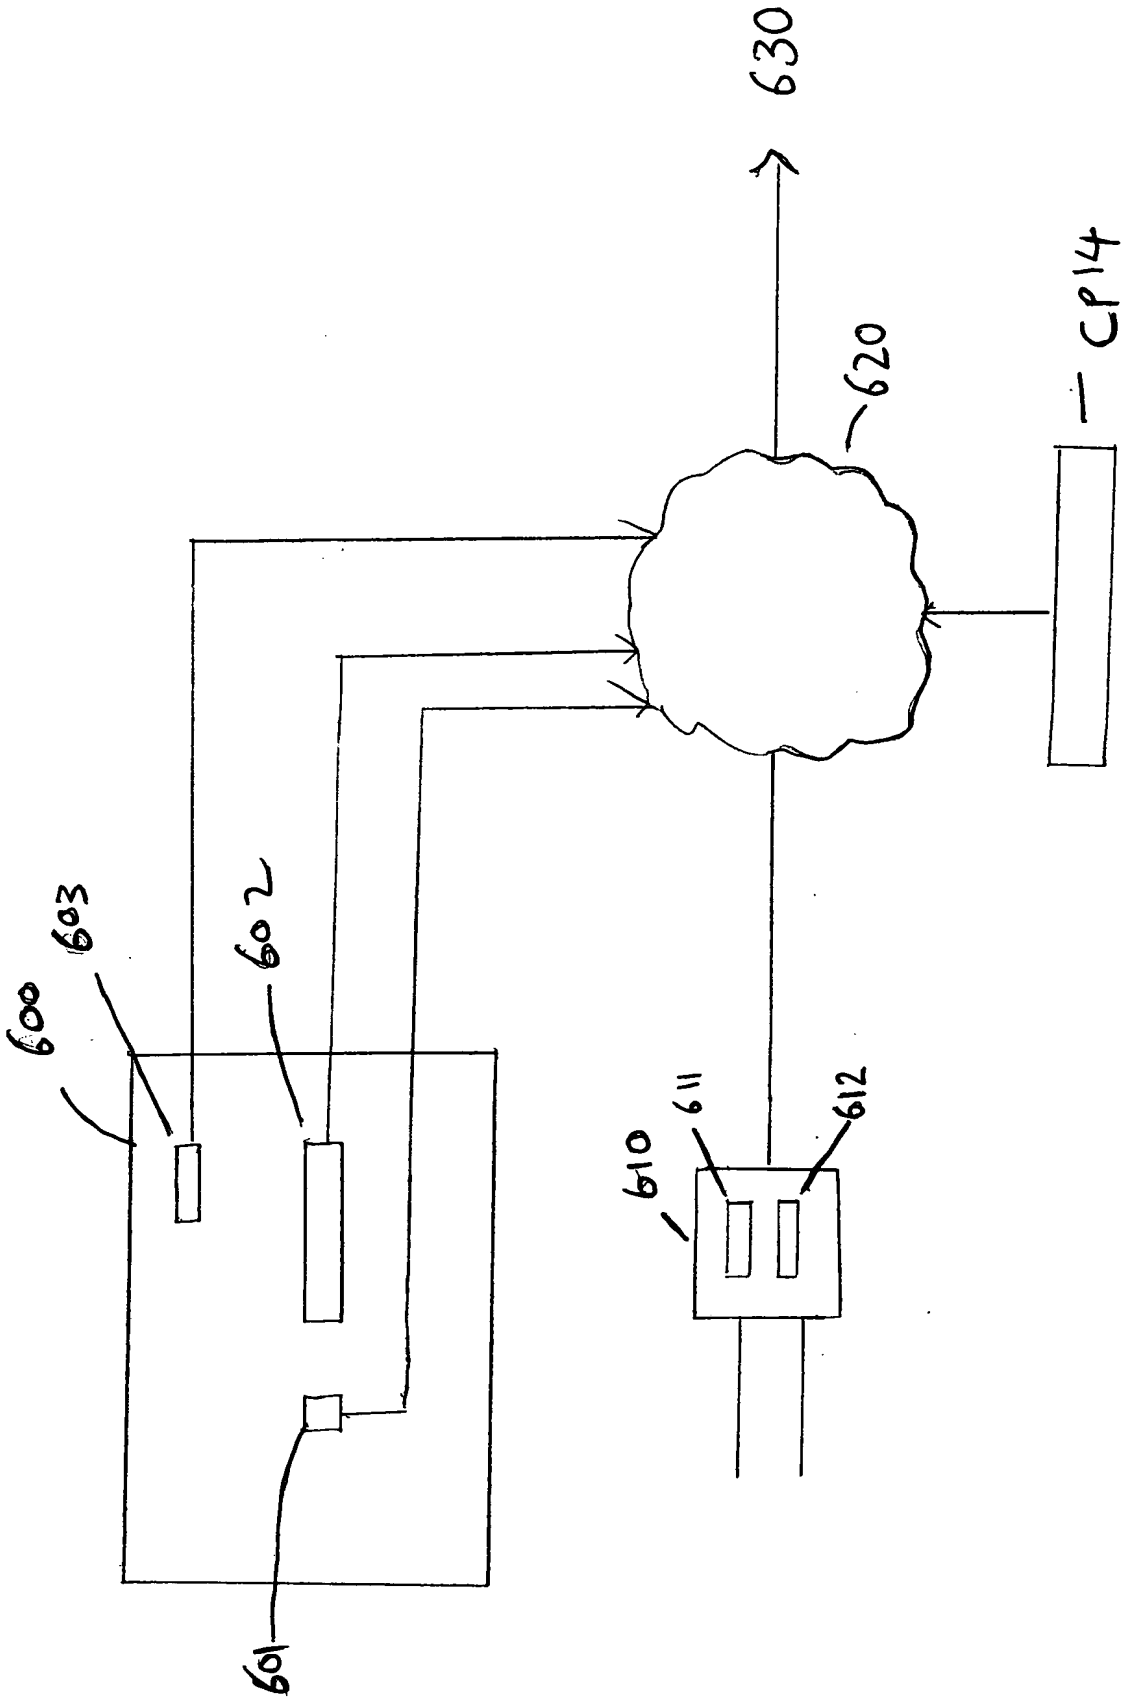

Figure 68

CP14 bits in Debug and Status Control register			meaning
Secure debug enable bit	Secure user-mode debug enable bit	Secure thread-aware debug enable bit	
0	X	X	No intrusive debug in entire secure world is possible. Any debug request, breakpoints, watchpoints, and other mechanism to enter debug state are ignored in entire secure world.
1	0	X	Debug in entire secure world is possible
1	1	0	Debug in secure user-mode only. Any debug request, breakpoints, watchpoints, and other mechanism to enter debug state are taken into account in user mode only. (Breakpoints and watchpoints linked or not to a thread ID are taken into account). Access in debug is restricted to what secure user can have access to.
1	1	1	Debug is possible only in some particular threads. In that case only thread-aware breakpoints and watchpoints linked to a thread ID are taken into account to enter debug state. Each thread can moreover debug its own code, and only its own code.

Figure 69A

CP14 bits in Debug and Status Control register			meaning
Secure trace enable bit	Secure user-mode debug enable bit	Secure thread-aware debug enable bit	
0	X	X	No observable debug in entire secure world is possible. Trace module (ETM) must not trace internal core activity.
1	0	X	Trace in entire secure world is possible
1	1	0	Trace is possible when the core is in secure user-mode only.
1	1	1	Trace is possible only when the core is executing some particular threads in secure user mode. Particular hardware must be dedicated for this, or re-use breakpoint register pair: Context ID match must enable trace instead of entering debug state.

Figure 69B

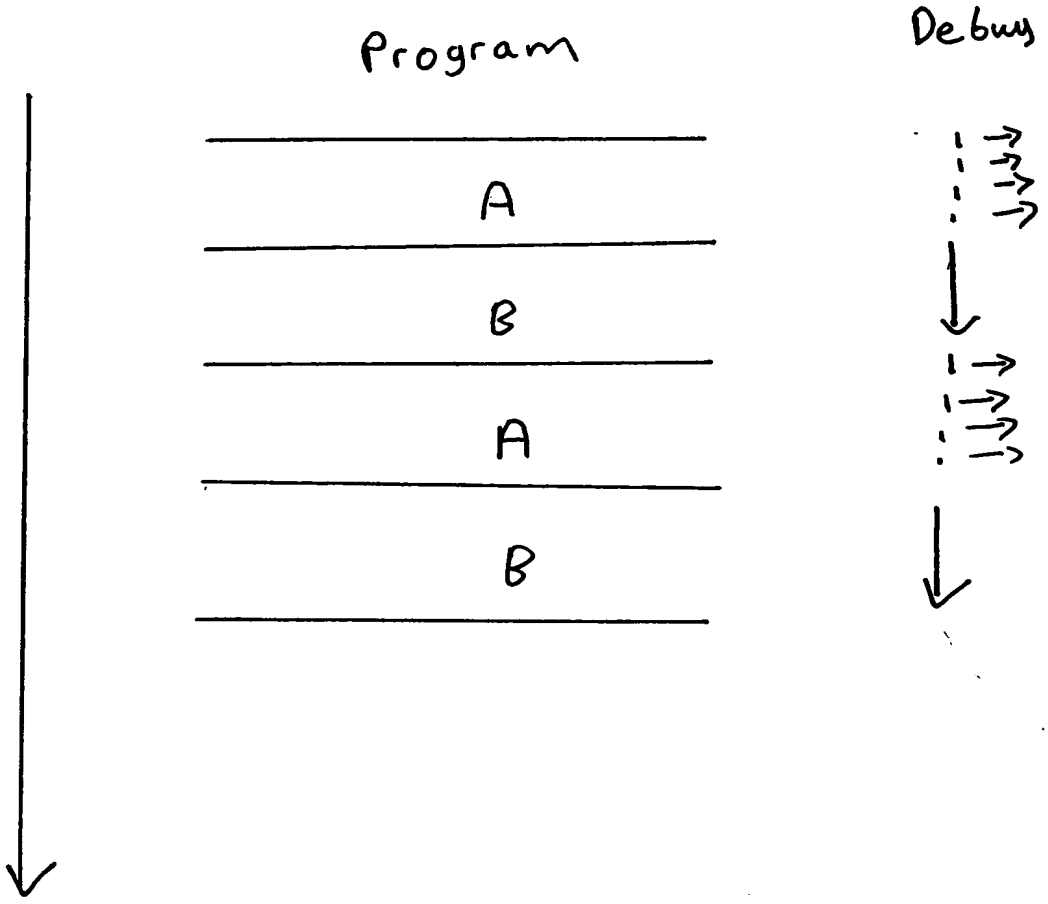

Figure 70

Method of entry	Entry when in non-secure world	entry when in secure world
Breakpoint hits	Non-secure prefetch abort handler	secure prefetch abort handler
Software breakpoint instruction	Non-secure prefetch abort handler	secure prefetch abort handler
Vector trap breakpoint	Disabled for non-secure data abort and non-secure prefetch abort interruptions. For other non-secure exceptions, prefetch abort.	Disabled for secure data abort and secure prefetch abort exceptions ([1]). For other exceptions, secure prefetch abort.
Watchpoint hits	Non-secure data abort handler	secure data abort handler
Internal debug request	Debug state in halt mode	debug state in halt mode
External debug request	Debug state in halt mode	debug state in halt mode

(1) see information on vector trap register, ;

(2) Note that when external or internal debug request is asserted, the core enters halt mode and not monitor mode.

Figure 71A

Method of entry	Entry in non-secure world	entry in secure world
Breakpoint hits	Non-secure prefetch abort handler	breakpoint ignored
Software breakpoint instruction	Non-secure prefetch abort handler	instruction ignored ([1])
Vector trap breakpoint	Disabled for non-secure data abort and non-secure prefetch abort interruptions. For others interruption non-secure prefetch abort.	breakpoint ignored
Watchpoint hits	Non-secure data abort handler	watchpoint ignored
Internal debug request	Debug state in halt mode	request ignored
External debug request	Debug state in halt mode	request ignored
Debug re-entry from system speed access	not applicable	not applicable

([1]) As substitution of BKPT instruction in secure world from non-secure world is not possible, non-secure abort must handle the violation.
